ABSTRACT

Written assignments in college courses are most often analytical in nature (i.e., essays—expository or persuasive, book or research paper reviews, annotated bibliographies, research papers, etc.). The one notable exception is creative writing, where assignments are typically fiction, literary nonfiction, and poetry. While the creative approach to writing is rarely utilized outside this specific area, there is mounting evidence that it has much to offer to learning in all areas of study. Studies show that reflective writing (pieces in which the student writes about the personal element of his or her learning experience) is an important component in a successful learning process, regardless of the subject or field of study. Reflective writing facilitates deep-level processing and has been shown to be an important positive element of experiential learning. This paper will discuss these findings and present an example of the use of reflective writing in the context of an experiential field-based environmental studies course.
