"I recommend the most complete respiratory protection available - Vista® Once SQ."

Ethan Andress, DVM
North Dakota

Vista® Once SQ is the most complete respiratory protection available, offering 5-way modified live viral protection in combination with the only avirulent-live culture Pasteurella and multocida Mannheimia haemolytica protection. And it's backed by respiratory research validating:

- Respiratory duration of immunity of at least:
  - 182 days for Infectious Bovine Rhinotracheitis (IBR)
  - 206 days for Bovine Virus Diarrhea (BVD) Type 1
  - 200 days for BVD Type 2
- Three-day onset of immunity for IBR respiratory protection
- BVD Type 1b cross protection
- BVD Type 2 protection in the face of maternal antibodies

The five-way protection of Vista also is available in combination with the only single-dose Lepto hardjo-bovis protection: Vista 5 VL5 SQ.

Offer the most complete respiratory protection available — recommend Vista vaccines to your clients today.

AVMA Delegate ............. Mark Spire, DVM, Manhattan, Kansas
GENERAL SESSIONS
• Grumpy old vets revisited
  Ken Nordlund ................................................................. 1
• Adapting beef practice to future realities
  G. Kee Jim ........................................................................ 7
• The buyer’s point of view about animal welfare: what milk
  purchasers are looking for
  Jennifer B. Walker ............................................................ 11
• Dairy stockmanship – Reconnecting the people with the cows
  Paul Rapnicki, Margaret Perala, Don Höglund.......................... 13
• Fee structure models in dairy practice
  Mark Thomas ................................................................. 20
• Beef practice models
  Murray D. Jelinski ............................................................ 22
• Veterinary technicians: The case for their employment in
  bovine practice
  Sarah Wagner ..................................................................... 26
• The Summer Dairy Institute: Advanced training for young
  dairy veterinarians
  Charles W. Nydam, Daryl V. Nydam, Charles L. Guard,
  Robert O. Gilbert, Steve Eicker .......................................... 28

BEEF SESSIONS
• Integrated program for reducing bovine respiratory disease
  complex in beef and dairy cattle coordinated agricultural
  project (BRD CAP)
  Alison L. Van Eenennaam .................................................. 36
  • What’s new in timed artificial insemination and assisted
    reproduction in beef cattle?
    Reuben J. Mapleton, Gabriel A. Bó ..................................... 40
  • Case-based studies of infertility in bulls
    A.D. Barth ....................................................................... 50
  • The potential value of DNA-based tests for host bovine
    respiratory disease resistance to the beef cattle industry
    Alison L. Van Eenennaam .................................................. 60
  • A beef producer’s view of the role of bovine practitioner
    J. P. Rhea ........................................................................ 66
  • Past, present, and future – rural veterinarian
    Murray D. Jelinski ............................................................ 69
  • Cattle market update – What we need to know
    Anne Dunford .................................................................... 73
  • Using mixed treatment comparison meta-analysis to compare
    interventions in bovine practice
    Annette M. O’Connor ....................................................... 76

DAIRY SESSIONS
• Why cows die on dairies
  Franklyn Garry, Craig McConnel ......................................... 82
• Mortality in different management systems
  Chad D. Dechow, Robert C. Goodling ................................. 88
• The behavioral and physiological consequences of
  overstocking dairy cattle
  Julie M. Huzey, Marina A. G. von Keyserlingk,
  Thomas R. Overton .......................................................... 92
• Managing high-risk fresh cows
  Garrett R. Oetzel .............................................................. 98
• The importance of dairy herd health provision and data
  management, with a focus on mastitis control
  Martin Green, Andrew Bradley, Chris Hudson,
  James Breen, Jonathan Statham, Jon Huxley ......................... 105
• Drug usage hazard analysis and critical control points
  (HACCP)
  David A. Rhoda .............................................................. 110
• Parlor performance basics
  David A. Reid ................................................................. 114
• Reproductive tract infection and inflammation in dairy cows
  Stephen LeBlanc .............................................................. 116
• Estrus detection and timed AI protocols: complementary
  not mutually exclusive
  Ricardo Chebel .................................................................. 123

AABP-AAESRP JOINT SESSIONS
• Diagnosis and control of small ruminant abortion
  Paula I. Menzies .............................................................. 129
• Q fever update
  Paula I. Menzies .............................................................. 138
• Pregnancy toxemia and metabolic changes of transition in
  small ruminants
  Robert J. Van Saun .......................................................... 142
• Selenium nutrition and therapy in small ruminants
  Robert J. Van Saun .......................................................... 148
• Understanding copper nutrition in small ruminants
  Robert J. Van Saun .......................................................... 155
• Johne’s disease in sheep and goats
  Paula I. Menzies .............................................................. 161

STUDENT SESSION
• Difficult conversations with clients
  Glennon Mays .................................................................. 175
• Difficult conversations with colleagues and staff
  Keith Sternen .................................................................. 175

RESEARCH SUMMARYS I
• Evaluation of environmental culture to determine herd status
  for Johne’s disease on Atlantic Canadian dairy farms
  C.J. Lavers, G.P. Keefe, S.L.M. McKenna, I.R. Dohoo,
  M. Chaffer ................................................................. 178
• Evaluation of the milk ELISA to determine herd status for
  Johne’s Disease
  C.J. Lavers, G.P. Keefe, S.L.M. McKenna, I.R. Dohoo,
  M. Chaffer ................................................................. 179
• Effect of season and lactation stage on the diagnostic
  sensitivity of direct real-time PCR assay for detection of
  fecal shedding of Mycobacterium avium subsp
  paratuberculosis
  E. Laurin, G. Keefe, S. McKenna, M. Chaffer ..................... 181
• Preliminary program outcomes from the Atlantic Johne’s
  Disease Initiative
  Karen MacDonald-Phillips, Greg Keefe, Shawn McKenna ......... 184
• Intramammary infection at calving following Petrifilm-based
  selective dry cow therapy
  M. Cameron, G. Keefe, J. P. Roy, K. MacDonald .................. 183
• Preliminary results from a non-inferiority clinical trial
  evaluating the efficacy of three commercial dry cow mastitis
  preparations
  A. G. Arruda, S. Godden, P. Rapnicki, P. Gorden,
  L. Timms, S. Aly, T. Lehenbauer, J. Champagne ................. 184
• Risk factors for Prototheca mastitis on Ontario dairy farms
  Laura Pieper, Ann Godkin, David Kelton ........................... 185
• Understanding and controlling variability of iodine concentration in bulk-tank milk in Canada
• Evaluation of a Petrifilm-based on-farm culture system for the detection of intramammary infections in cows with low somatic cell counts at dry-off
M. Cameron, G. Keefe, J. P. Roy, K. MacDonald .................................................. 187
• The association between β-hydroxybutyrate concentration at diagnosis of left displaced abomasum in dairy cows and removal from the herd post-surgical correction
William Croushore, Paula Oslna, David Welch, Daniel Zawisza, Daryl Nydam....................... 189
• Profitability of preconditioning: lessons learned from an 11-year case study of an Indiana beef herd
W. Mark Hilton, Nicole J. Olynk ................................................................. 190
• Comparison of 5-day versus 7-day CIDR CO-Synch protocol in crossbred commercial beef cows
• Isolation of Mycobacterium avium ssp paratuberculosis from the saliva of cattle: a pilot study
U. S. Sorge, S. Kurnick, S. Sreevalsan.............................................. 192
• Efficiency of a genetic test to detect benzimidazole-resistant Haemonchus contortus nematodes on sheep farms in Québec
V. Barrere, R.K. Pritchard ................................................................. 193

RESEARCH SUMMARIES II
• Milk flow obstruction caused by varicose veins in the teats in dairy cattle: 22 cases
H. Lardé, S. Nichols, A. Desrochers, M. Babkine, D. Francoz, P.Y. Mulon .................................................. 195
• Digital dermatitis: a description of lesion progression and regression of natural disease in Holstein dairy cattle over two years
A. Krull, P. Gorden, J. Shearer, B. Leuschcn, P. Plummer ................................................................. 197
• Pharmacokinetics and milk elimination of flunixin meglumine in dairy cattle following different routes of administration
L. Kissell, G.W. Smith, T.L. Leavens, R.E. Baynes, J.E. Riviere................................................................. 198
• Temporal changes in antimicrobial resistance of fecal coliforms isolated from dairy cows
E.M. Corbett, B. Norby, L.W. Halbert ................................................................. 199
• Reproductive performance with an automated activity monitoring system versus a synchronized breeding program
Rafael C. Neves, Stephen J. LeBlanc ................................................................. 200
• Detection of hyperketonemia in dairy cows: “in-lab” milk components performance
J. Denis-Robichaud, J. Dubac, D. Lefebvre, L. DesCoteaux .................................................. 201
• Comparison of crossbred and purebred Holstein cows during the transition period
L.G. Mendonça, N.B. Litherland, M.A. Ballou, R.C. Chebel ................................................................. 203
• Efficacy of a combination butaphosphan-cyanocobalamin product and insulin for the treatment of ketosis in lactating dairy cattle
• Comparison of serum concentrations and duration of BVDV 1, BVDV 2, BHV-1, BRSV, and PI3 virus-neutralizing antibodies in calves fed maternal colostrum or a colostrum replacer at birth
M.F. Chamorro, P.H. Walz, D.M. Haines, T. Passler, T. Earlwyine, M.D. Givens .......................... 206
• A randomized clinical trial to evaluate the effect of oral zinc supplementation as a treatment for diarrhea in neonatal Holstein calves
• Health care metrics and health care policies during the preweaned period on calf ranches
• Otitis media and interna in dairy calves: a retrospective study of 29 cases
V. Bernier Gosselin, G. Fectue, D. Francoz, A. Desrochers, S. Nichols, M. Babkine .................. 210
• Ultrasound evaluation of tympanic bulla in calves
V. Bernier Gosselin, M. Babkine, S. Nichols, A. Desrochers .................................................. 211

RESEARCH SUMMARIES III
• Use of neurostimulation to localize and anesthetize the brachial plexus of calves undergoing metacarpal surgery
H. Lardé, S. Nichols, A. Desrochers, G. Bussières, M. Kopal .................................................................................. 212
• Surgery of the bovine rumen: indications and factors relating to outcomes in cattle in Ohio and Kansas
AK Hartnack, MR Rousseau, AJ Niehaus, DE Anderson .................................................. 214
• An evaluation of the prevalence of BHV-1 abortions based on diagnostic submissions to five U.S. veterinary diagnostic laboratories
S. Gould, A.M. O’Connor, V. Cooper ................................................................. 215
• Real-time PCR assay for trichomonosis on pooled direct preputial samples
A. Garcia Guerra, J. E. Hill, J. Campbell, C. Waldner, S. Hendrick ................................................................. 216
• Clinical sensitivity and specificity of a quantitative PCR assay for bovine genital campylobacteriosis in bulls
A. Garcia Guerra, B. Chaban, J. E. Hill, C. Waldner, S. Hendrick ................................................................. 217
• Bovine coronavirus from the respiratory tract: antigenic and genetic diversity
R. W. Fulton, J. F. Ridpath, L. J. Burge ................................................................. 218
• A survey of herd-level risk factors for bovine respiratory disease (BRD) in nursing beef calves
• Immune, health, and growth responses of beef calves administered modified-live virus respiratory vaccine in the presence of maternal antibody versus a traditional vaccination regimen
• A survey to evaluate anthelmintic resistance of gastrointestinal strongyles in Iowa cow/calf operations
• Biosecurity practices of midwestern veterinarians in food animal and mixed animal practices
  T. J. Engelken, D. Bickett-Weddle, C. Wang .................... 222

• The use of homeopathic remedies for the treatment of calves with diarrhea
  E. M. Boldyrevra .................................................. 223

• Effect of demographic trends in livestock inventory and number of operations on food animal veterinary practices in the United States
  G. M. Schuenemann, W. P. Shulaw ................................ 224

• Results of anti-mortem screening methodology to predict prescribed drug withholding periods for flunixin and ceftiofur in heifers
  S. Jones, J. Wells, D. Griffin, K. Shuck, T. Goldsmith, P. Rapnicki .................................................. 225

• Identification and antimicrobial resistance of Bibersteinia trehalosi

RESEARCH SUMMARIES IV
• Feeding heat-treated colostrum reduces morbidity in preweaned dairy calves
  S. M. Godden, D. J. Smolenski, M. Donahue, J. M. Oakes, S. Wells, J. Fetrow ........................................ 228

• Effect of heat-treatment on nutritional and immune factors in bovine colostrum
  S. M. Godden, K. Hauser, N. Koewler, K. Brakefield, M. Van Amburgh, P. Rapnicki ........................................ 229

• Evaluation of serum immunoglobulin G concentrations in dairy calves by use of an automated turbidimetric immunoassay
  M. L. Alley, D. M. Haines, G. W. Smith ............................ 230

American Association of Bovine Practitioners

Prudent Drug Usage Guidelines

The production of safe and wholesome animal products for human consumption is a primary goal of members of the AABP. In reaching that goal, the AABP is committed to the practice of preventive immune system management through the use of vaccines, parasiticides, stress reduction and proper nutritional management. The AABP recognizes that proper and timely management practices can reduce the incidence of disease and therefore reduce the need for antimicrobials; however, antimicrobials remain a necessary tool to manage infectious disease in beef and dairy herds. In order to reduce animal pain and suffering, to protect the economic livelihood of beef and dairy producers, to ensure the continued production of foods of animal origin, and to minimize the shedding of zoonotic bacteria into the environment and potentially the food chain, prudent use of antimicrobials is encouraged. Following are general guidelines for the prudent therapeutic use of antimicrobials in beef and dairy cattle.

1. The veterinarian’s primary responsibility to the client is to help design management, immunization, housing and nutritional programs that will reduce the incidence of disease and the need for antimicrobials.

2. Antimicrobials should be used only within the confines of a valid veterinarian-client-patient relationship; this includes both dispensing and issuance of prescriptions.

3. Veterinarians should properly select and use antimicrobial drugs.
   a. Veterinarians should participate in continuing education programs that include therapeutics and emerging and/or development of antimicrobial resistance.
   b. The veterinarian should have strong clinical evidence of the identity of the pathogen causing the disease, based upon clinical signs, history, necropsy examination, laboratory data and past experience.
   c. The antimicrobial selected should be appropriate for the target organism and should be administered at a dosage and route that are likely to achieve effective levels in the target organ.
   d. Product choices and regimens should be based on available laboratory and package insert information, additional data in the literature, and consideration of the pharmacokinetics and pharmacodynamics of the drug.
   e. Antimicrobials should be used with specific clinical outcome(s) in mind, such as fever reduction, return of mastitic milk to normal, or to reduce shedding, contagion and recurrence of disease.
   f. Periodically monitor herd pathogen susceptibility and therapeutic response, especially for routine therapy such as dry cow intramammary antibiotics, to detect changes in microbial susceptibility and to evaluate antimicrobial selections.
   g. Use products that have the narrowest spectrum of activity and known efficacy in vivo against the pathogen causing the disease problem.
   h. Antimicrobials should be used at a dosage appropriate for the condition treated for as short a period of time as reasonable, i.e., therapy should be discontinued when it is apparent that the immune system can manage the disease, reduce pathogen shedding and minimize recurrence of clinical disease or development of the carrier state.
   i. Antimicrobials of lesser importance in human medicine should be used in preference to newer generation drugs that may be in the same class as drugs currently used in humans if this can be achieved while protecting the health and safety of the animals.
   j. Antimicrobials labeled for use for treating the condition diagnosed should be used whenever possible. The label, dose, route, frequency and duration should be followed whenever possible.
   k. Antimicrobials should be used extra-label only within the provisions contained within AMDUCA regulations.
   l. Compounding of antimicrobial formulations should be avoided.
   m. When appropriate, local therapy is preferred over systemic therapy.
   n. Treatment of chronic cases or those with a poor chance of recovery should be avoided. Chronic cases should be removed or isolated from the remainder of the herd.
   o. Combination antimicrobial therapy should be discouraged unless there is information to show an increase in efficacy or suppression of resistance development for the target organism.
   p. Prophylactic or metaphylactic use of antimicrobials should be based on a group, source or production unit evaluation rather than being utilized as standard practice.
   q. Drug integrity should be protected through proper handling, storage and observation of the expiration date.

4. Veterinarians should endeavor to ensure proper on-farm drug use.
   a. Prescription or dispensed drug quantities should be appropriate to the production-unit size and expected need so that stockpiling of antimicrobials on the farm is avoided.
   b. The veterinarian should train farm personnel who use antimicrobials on indications, dosages, withdrawal times, route of administration, injection site precautions, storage, handling, record keeping and accurate diagnosis of common diseases. The veterinarian should ensure that labels are accurate to instruct farm personnel on the correct use of antimicrobials.
   c. Veterinarians are encouraged to provide written guidelines to clients whenever possible to describe conditions and instructions for antimicrobial use on the farm or unit.
